CYBERIUM

The QUIETER you become, the more you are able to HEAR

KALI LINUX

ETHICAL HACKERS

INTRODUCTION

Kali Linux is a powerful, open-source Linux distribution tailored specifically for ethical hacking and penetration testing. It comes preloaded with a comprehensive suite of security tools, such as Nmap, Wireshark, Metasploit, and Burp Suite, which are essential for identifying and exploiting vulnerabilities in networks and systems. The platform is designed to facilitate the entire penetration testing process, from reconnaissance to exploitation and post-exploitation analysis.

For ethical hackers, Kali Linux offers the benefit of a unified, robust environment that streamlines the testing process, enhances productivity, and ensures that they are equipped with the latest tools to tackle emerging cybersecurity threats. Its flexibility and extensive documentation make it accessible to both beginners and seasoned professionals, empowering them to conduct thorough and efficient security assessments while adhering to legal and ethical standards.

Kali Linux course is invaluable for ethical hacking, providing the essential skills and knowledge needed to effectively conduct penetration testing and strengthen cybersecurity defenses. Attending the Kali Linux training from CyberiumX will equip you with the essential skills and expertise in ethical hacking, making you a critical asset in the rapidly evolving cybersecurity landscape. Mastering Kali Linux is fundamental for effectively identifying and mitigating security vulnerabilities.

Course Duration- 20 Hours

KALI LINUX COURSE SYLLABUS

Module 01- Introduction and Installation

1. Introduction to Linux Operating System
2. Difference between Linux and Windows OS
3. Various Linux Distributions
4. Installing Kali Linux on a Virtual Platform

Module 02- File Handling

1. Accessing and Navigating the Command Line Interface
2. Managing Files through Command Line Operations
3. Creating, Viewing, and Editing Text Files
4. Managing Linux File System Permissions for File Access Control
5. Monitoring and Administering Linux Processes
6. Working with Vim and Nano text editors
7. Using Find and Grep commands for searching and pattern matching

Module 03- User Administration

1. Creating New User Accounts
2. Setting and Changing Passwords for Users
3. Removing or Deleting User Accounts
4. Retrieving User Information
5. Obtaining Password Hashes of Linux Users

Module 04- Group Administration

1. Creating New Groups
2. Adding Users to Specific Groups
3. Establishing Administrative Users for Groups
4. Removing Users from Groups
5. Deleting Existing Groups
6. Obtaining Group Information

Module 05- Linux Package Manager

1. Understanding various kinds of Package Managers
2. Updating the Repository
3. Upgrading Applications
4. Installing Application and Softwares using Package Managers
5. Removing Application from Kali Linux

Module 06- Standard Input, Output and Error

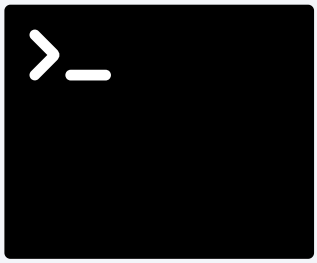

1. Understanding Standard Input, Output and Error in Linux
2. Working with various use cases
3. Linux Operators
4. Combination of Linux Operators

Module 07- : Task Automation in Linux

1. Understanding Cronjobs
2. Working with Crontab tool
3. Scheduling Tasks for different Users
4. Online Websites to generate Crontab line

Module 08- File Compressing and Archiving

1. Understanding the concept behind the Compression and Archiving
2. Compressing Files and Directories using various tools
3. Decompressing Files and Directories
4. Grouping Files of similar types
5. Adding Files in an existing Archive
6. Extracting Files from Archive

Module 09- Process Management

1. Understanding Linux Processes
2. Managing Processes on Linux using various tools
3. Terminating Processes

Module 10- Network Configuration & Administration

1. Configuring Network Settings
2. Enabling and Disabling Network Interfaces
3. Providing Static IP Address
4. Setting Host Names and Configuring Name Resolution
5. Configuring Hosts file

Module 11- SSH & Firewall Configuration

1. Setting up SSH and SecureCopy (SCP) Configurations
2. Password-less Login on SSH and SCP
3. Basic Firewall Configuration using Firewalld
4. Configuring Secure Rules on Firewall
5. Setting up different Zones
